

# Monday, illustrated

Every screen below was driven by `scripts/walk_runbook.py` against a sandbox — signed in as the person the step belongs to, clicking the controls a person clicks. Nothing here is a mock-up, and nothing was photographed from the live record: the walk seals and computes, so it is refused a working instance.

---

**The walk found one thing before its first screenshot.** `POST /api/rates/compute` was complete on the server, named in a comment on the rates screen, and **called by nothing in the application** — so the one figure the whole engagement exists to produce could only be made by somebody running a script. Step 4 could not be performed. It can now.

A runbook nobody has walked is a list of things somebody believes.

**The sandbox is a copy of the record, reopened so the seal and compute steps could be photographed being performed.** Earlier versions walked a sandbox built from empty, which showed the screens honestly and showed every figure on them as a stranger. These are the real classifications, the real 61-invoice register and the real restatement — with three groups deliberately reopened so the queue is photographed with work in it, and the seal taken off so step 3 is a step rather than a description.

The live record is sealed and computed, so **Monday is a review rather than a build**. What is outstanding, and what to do if a judgment has to change, is `docs/MONDAY_RUNBOOK.md` §0 and §C. The recommendations to check against are `docs/MONDAY_ANCHOR.pdf`.

## GETTING IN

---

The door. Everything below is behind somebody's own account.

YOUNGSTOWN BUSINESS INCUBATOR

### Cost allocation

Every classification, document and rate is recorded against the person signed in. Sign in as yourself.

Email

Password

Sign in

Everything below is behind somebody's own account. An account on a password an administrator chose cannot write anything — not a classification, not a timesheet, not a certification — until the person changes it. The one exit from that gate is changing your own password.

What you hold, and what is yours to do today.

Good to see you, Tom Metzinger

Classification, the seal, and the rate that follows from it — in that order, which is the order the audit file rests on.

What is waiting on you

You hold CONTROLLER, so this is everything — each row says whose work it is

| What                                                                                           | Items | Amount    | Whose      |                      |

People to chase

You cannot sign these — 2 CFR 200.430(i) wants the signature of the person whose effort it was. What you can do is go and ask, and this is who, on which work.

The landing page is assembled from what you hold, not switched on a role. The tabs are what is *yours to do*; a screen you may read but have no work on is still reachable by URL. Tom holds CONTROLLER, so he sees everything — that is what the portfolio means, not a special case.

## RECONCILE

---

## STEP 1 Tom · controller /reconcile

Schedule A-1 — the eleven points where the ledger, the P&L, the balance sheet and the payroll register have to agree. This is the gate: a rate is refused while any of them is open.

Reconciliation

A-1

Eleven points at which the general ledger, the profit and loss, the balance sheet and the payroll register are required to agree. Run before anything is classified, because a reconciliation produced after the rate is one nobody can believe.

|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------|---------------------------------------------------------------|--------------|
| <div>✓</div> <div><b>Profit and loss foots to the net income the sheet carries</b><br/>PL_FOOTING</div>                                                                                                                                                 | <div>P&amp;L sections</div> <div>4,329</div>                    | <div>Balance sheet net income</div> <div>4,329</div>          | 0            |
| Net income as the P&L computes it must equal what the sheet carries in equity. Two exports that disagree are two different moments in the same books, and everything built on either is suspect.                                                        |                                                                 |                                                               |              |
| <div>✓</div> <div><b>Balance sheet balances</b><br/>BS_FOOTING</div>                                                                                                                                                                                    | <div>Assets</div> <div>16,713,220</div>                         | <div>Liabilities and equity</div> <div>16,713,220</div>       | 0            |
| Assets less liabilities and equity.                                                                                                                                                                                                                     |                                                                 |                                                               |              |
| <div>✓</div> <div><b>Every staged line reached the ledger</b><br/>GL_PROMOTE_COMPLETE</div>                                                                                                                                                             | <div>Dated lines staged</div> <div>15,500</div>                 | <div>Lines in the ledger</div> <div>15,500</div>              | 0            |
| The promote path dedupes on each line's natural key. When two genuinely different lines hash alike one is dropped and nothing raises: 71 lines carrying \$24,082.67 went that way before the key learned to number repeats. This counts them.           |                                                                 |                                                               |              |
| <div>✓</div> <div><b>Printed account totals agree with the parsed lines</b><br/>GL_SUBTOTALS</div>                                                                                                                                                      | <div>Printed</div> <div>14,371,299</div>                        | <div>Parsed</div> <div>14,371,299</div>                       | 0            |
| QuickBooks prints its own account totals. Reconciling against them catches almost every parsing mistake and costs nothing.                                                                                                                              |                                                                 |                                                               |              |
| <div>✓</div> <div><b>Ledger P&amp;L-scope activity agrees with the P&amp;L by section</b><br/>GL_PL_SECTION</div>                                                                                                                                       | <div>Ledger</div> <div>13,554,754</div>                         | <div>P&amp;L</div> <div>13,554,754</div>                      | 0            |
| Section totals are where a mis-sectioned account shows: four leaves in this chart sit under both an income and an expense parent, and reading an expense as revenue moves the section without moving the grand total.                                   |                                                                 |                                                               |              |
| <div>✓</div> <div><b>Ledger agrees with the P&amp;L account by account</b><br/>GL_PL_ACCOUNT</div>                                                                                                                                                      | <div>Gross difference</div> <div>14,940</div>                   | <div>Left unexplained</div> <div>0</div>                      | 0 exceptions |
| Sections can tie while accounts do not: money moved between two expense accounts nets to nothing at the section line. Each account that differs is either a named reconciling item with the ledger lines behind it, or it is unexplained.               |                                                                 |                                                               |              |
| <div>✓</div> <div><b>Every P&amp;L account exists on both sides</b><br/>GL_PL_COVERAGE</div>                                                                                                                                                            | <div>Ledger accounts absent from the P&amp;L</div> <div>0</div> | <div>P&amp;L accounts with no ledger lines</div> <div>0</div> | 0 exceptions |
| A P&L account with no ledger behind it cannot be classified, and a ledger account off the P&L is cost with nowhere to land.                                                                                                                             |                                                                 |                                                               |              |
| <div>✓</div> <div><b>Opening balance plus the year's movement equals the sheet</b><br/>GL_BS_ACCOUNT</div>                                                                                                                                              | <div>Accounts tied</div> <div>71</div>                          | <div>Accounts off</div> <div>0</div>                          | 0 exceptions |
| The tie the system could not make until the ledger's opening balances were kept. It proves the sheet off the ledger rather than trusting two exports to agree.                                                                                          |                                                                 |                                                               |              |
| <div>✓</div> <div><b>Accounts absent from the sheet closed at zero</b><br/>GL_BS_COVERAGE</div>                                                                                                                                                         | <div>Absent, closing at zero</div> <div>4</div>                 | <div>Absent, carrying a balance</div> <div>0</div>            | 0 exceptions |
| QuickBooks omits an account that ends at zero, which is a complete explanation and a checkable one. An absent account still carrying a balance is a hole in the sheet.                                                                                  |                                                                 |                                                               |              |
| <div>✓</div> <div><b>Split lines still sum to the lines they came from</b><br/>SEGMENTATION</div>                                                                                                                                                       | <div>Ledger</div> <div>14,371,299</div>                         | <div>Analytical</div> <div>14,371,299</div>                   | 0            |
| Splitting a line for classification is an analytical act on the same money. It must not change what there is.                                                                                                                                           |                                                                 |                                                               |              |
| <div>✓</div> <div><b>The payroll register agrees with the ledger's wage accounts</b><br/>PAYROLL_REGISTER</div>                                                                                                                                         | <div>Register</div> <div>1,835,047</div>                        | <div>Ledger wage accounts</div> <div>1,789,994</div>          | 0 exceptions |
| The fringe base comes from the register, not from the ledger, so a difference here is two denominators for one rate. None of the other ten points touches the register — which is how a \$45,000 donor credit sat in an intern wage account for a year. |                                                                 |                                                               |              |

**Step 1, and the gate.** Eleven points where the general ledger, the profit and loss, the balance sheet and the payroll register have to agree. `POST /api/rates/compute` answers 409 while any of them is open,

so nothing downstream can start here.

Read *state*, never a variance of zero: both sides of most controls are `COALESCE(..., 0)`, so an empty period compares zero against zero and looks green. A control that cannot be evaluated has not passed.

The eleventh is the payroll register, and it is the one that pays for itself — it is how a \$45,053 donor credit sitting in an intern wage account for a year was found, which moved the fringe rate from 22.45% to 21.90%.

## REVIEW

---

## STEP 2 Tom · controller /classify

The queue, in Sweep. Every group carries its recommendation; nothing has been accepted on anybody's behalf.

Help

Rates

Sealing hashes every live classification and freezes the set. Only then can a rate be computed, and the rate carries the seal — so it can be shown to be a consequence of the judgments rather than a target they were fitted to.

Before sealing

Two gates: the books must agree, and the queue should be finished

Dollar coverage

100.0%

Groups left

3

80% target

The base is complete enough to seal.

☒ The books agree with themselves — all 11 cross-reference points tie.

Seal decision set

Computed rates

%

No rate yet

Seal the decision set to unlock the rate phase. A database trigger refuses any rate whose seal does not match a sealed set.

Before sealing, with the queue finished. Two gates are shown and only one of them is coverage: the books must agree *and* the queue should be done. Coverage is the softer of the two — sealing below 80% is a judgment, while an open control is a refusal.

No rate exists yet. That is the design, not a gap.

### STEP 3 Tom · controller /rates

Sealed. The hash covers every live judgment in the set. Only now does computing become possible.

Rates

D

Sealing hashes every live classification and freezes the set. Only then can a rate be computed, and the rate carries the seal — so it can be shown to be a consequence of the judgments rather than a target they were fitted to.

Sealed

Sealed by Tom Metzinger — classifications can now change only by unsealing, which supersedes the rate

Dollar coverage

100.0%

Groups left

3

80% target

The base is complete enough to seal.

☒ The books agree with themselves — all 11 cross-reference points tie.

Unseal...

Compute the rate

Computing reads the sealed judgments and writes the rate against that seal. It is arithmetic, not a judgment — the judgment was sealing. Recomputing supersedes the rate on file rather than editing it.

Administrative labour —

a cost objective (YBI-GA bears indirect)

2 CFR 200 Appendix IV B puts the director's office, accounting and personnel administration in the G&A pool. Treating it as an objective allocates the indirect pool to its own administration, which recovers from nobody. It is recorded on the rate either way, so the workpaper says which was chosen.

Computed rates

%

No rate yet

Seal the decision set to unlock the rate phase. A database trigger refuses any rate whose seal does not match a sealed set.

Sealed — a01bdf3561a6cbe2...

X

**Step 3 — the judgment the whole system rests on.** Sealing hashes every live classification and freezes the set. Only CONTROLLER may do it and nothing automated may do it at all: a script that sealed would put the machine's name on the assertion that the rate was not fitted to a target.

Afterwards a classification can only change by unsealing with a written reason, which supersedes any rate already computed. The card now reads from the record — it said “Before sealing” over a sealed set until this walk photographed it.

## COMPUTE

## STEP 4 Tom · controller /rates

Computed. The basis for administrative labour is chosen on the screen rather than defaulted silently — it is worth about nine points of combined rate on the same judgments — and it is recorded on the rate. A trigger refuses any rate whose seal does not match a sealed set.

| INDIRECT COMBINED | 2,083,748.12 | MTDC           | 4,736,602.11 | 43.99% | PROPOSED | a01bdf3561a6... |

Computed 4 rates on the POOL basis, against the seal

×

Step 4, and the step that could not be taken until this walk. `POST /api/rates/compute` was complete on the server, named in a comment on this very screen, and **called by nothing in the application** — so the one figure the whole engagement produces could only be made by running a script.

The basis for administrative labour is chosen here rather than defaulted silently. It is worth about nine points of combined rate on the same judgments and it is recorded on the rate, so the workpaper says which was chosen. The first version of this button sent an empty body and computed 34.82% — the default, correctly, and not the basis this engagement settled on.

Every rate carries the seal hash. A database trigger refuses one whose seal does not match a sealed set.

## CHECK

## STEP 5 Tom · controller /review/rate

The build-up an auditor reads. Nothing on it is computed — every figure is read from the row it was recorded in.

Carve-outs

What was removed from a pool before the rate was struck

Nothing has been carved out of any pool. Where a carve-out is required — the facilities share attributable to tenants, for one — it is missing rather than zero.

Take it away

The same figures, in a workbook that says on its first sheet what is unfinished

Rate build-up (.xlsx)

**Step 5.** The build-up an auditor reads. **Nothing on this screen is computed** — every figure is read from the row it was recorded in, because a figure derived twice is one that can disagree with itself.

Read `pool_variance` and the four anchor rows. And read what it says above the figures: the rate is a working figure while anything is unfinished, and no 200.465 facilities carve-out is in it, because no facility on the record carries measured space.

## IN PARALLEL

The pre-filled sheet, offered as a convenience. It says it is optional before it says anything else, and names the three complete answers. Nothing here has been adopted for anybody.

+ Add another objective

The reconstruction of your year

Not yet — and here is why

Nobody has recorded your employment terms for this period, so there are no contracted hours to divide. Until then a draft would be a year of hours against an unknown denominator. Ask the administrator to record your status, your contracted hours and the dates you worked.

Is this sheet finished?

Until you submit it, this is a work in progress and the controller's reconstruction still stands for your year. A part-filled sheet is not allowed to speak for the whole period — it would say the objectives you have reached so far were all of it.

Nobody has recorded your employment terms for 2025, so there is nothing to measure a complete period against. Ask the controller to record your status, your contracted hours and the dates you worked.

☐ This is a complete record of the time I was compensated for in 2025, including the time I was not working on any project.

Submit the sheet

What this adds up to

Leave is recorded but left out of the base — it is not a final cost objective

Nothing entered yet

Enter a week and it will appear here as a distribution you can certify.

**Running in parallel, at their own pace.** The controller's reconstruction of a person's year, offered to the person whose work it was.

It says **this is optional** before it says anything else, and names three complete answers: type your own days and ignore it, adopt it and correct what is wrong, or leave it. A convenience that reads as an instruction is the one way this exercise produces forty-three signatures worth nothing.

2 CFR 200.430(i) does not require a contemporaneous record — it requires one that reflects the work performed, supported and reviewed after the fact. A reconstruction the person reads, corrects and signs meets that. One nobody ever saw does not, which is where 2025 has been sitting.

Certifying is a separate act on a separate screen, and only the person whose effort it was can perform it.

| AM-OTHER | 0.3%  | 315.77    | reconstructed |

**Certification**

I certify that the distribution of effort shown above is a reasonable reflection of the total activity for which I was compensated in the period stated, across all activities, federally funded or otherwise. I understand this certification supports charges to Federal awards and that it will be relied upon by the organisation's auditors.

☐ I have read the statement above and it is true to the best of my knowledge.

Sign certification

Your name, the time, and the distribution exactly as it stands now are recorded together. If the distribution changes later, this signature is marked stale rather than quietly carried over.

Certifying is a **separate act on a separate screen**. Adopting puts hours on a sheet; signing says the sheet is true. One button doing both would take a signature from somebody who had only meant to accept a starting point.

Nobody signs for anybody else. A project manager cannot sign on their team's behalf — `v_certification_chase` is a list to go and ask, never an action.

What is outstanding, routed to the portfolio that can act on it.

What is outstanding, routed to the portfolio that can act on it. A CONTROLLER sees everything; an item whose portfolio nobody holds still reaches the controller rather than falling off the end.

Anybody holding a portfolio can recommend an item to somebody else with a reason — and that raises work, never a number.

THE REGISTER, AND WHAT IT RESTATES TO

THE REGISTER, AND WHAT IT RESTATES TO Tom · controller /contracts

The income half. A charge code, who may charge it, the contract it works under, and the invoices issued against it. The register held three invoices from one month until the year arrived; it holds 61 now, reconciled to the ledger's grant income.

Contracts

Charge codes

People

What each contract earns, what it is spending, who may charge it, and the money that has actually arrived. A charge code is a cost objective — the same one the ledger is classified into — so an hour and a dollar spent on the same work land in the same place.

Portfolio

Earned against spent, per contract

| Contract                              | Sponsor                              | Ceiling   | Invoiced | Received         | Cost so far | Milestones | Term ends  |
|---------------------------------------|--------------------------------------|-----------|----------|------------------|-------------|------------|------------|
| AM-DRIVE-AM<br>Drive AM               | NCDMM / America Makes                | 1,103,594 | 616,835  | 0<br>616,835 out | 181,881     | none yet   | 2026-01-04 |
| AM-ICAM-DIGENG<br>Digital Engineering | NCDMM / Energetics Technology Center | 1,000,690 | 579,074  | 0<br>579,074 out | 169,975     | none yet   | 2025-07-09 |

| AM-HYBRID-P2<br>Hybrid II             | NCDMM / America Makes                | 512,409   | 188,790  | 0<br>188,790 out | 15,000      | none yet   | 2026-06-30 |

Cost so far is what has been *classified* to the contract's objective, not what it cost. Classification is unfinished, so this understates — which is why no margin is shown here. A margin over an incomplete cost side flatters in exactly the direction nobody should be flattered.

The income half, and the half that has to exist *before* the year is worked: a code opened, somebody assigned to it, a deliverable, an invoice, and the money against it. The register held **three invoices from one month** until the 2025 billing arrived — and four published figures had been computed against it as though it were the year. It holds 61 now, and the ledger's own grant income is the control: six of the seven streams agree, four of them to the cent.

The restatement. The position is the REBUILD against the cost record — labour taken down to wages plus fringe before indirect goes on — and the invoice-only reading is kept beside it, labelled, because it is what every document written before today quotes. Everything is PROPOSED until a sponsor says otherwise in writing.

Restatement

Every invoice on an objective measured against the sealed rate, in the direction the difference actually runs. Everything upstream — the classification, the seal, the rate, the allocation — exists so that a number put in front of NCDMM can be traced back to a judgment somebody signed their name to.

What it will be measured against

Indirect combined  
43.99%  
computed 9/14/2026

Status

The point of the whole system, and the screen that decides what YBI puts in front of a sponsor. The position is the **rebuild** — the labour line taken down to wages plus fringe from the cost record before

indirect goes on — because these invoices bill labour that already carries indirect. The invoice-only reading is kept beside it and labelled, never as the position: it is what every document written before today quotes, and the two differ by \$722,095.49. Everything here is PROPOSED until a sponsor says otherwise in writing.

The same record as the auditor sees it. Reading the cost record is one permission and they hold it by rank; they hold no portfolio and can change nothing.

| A pledge from Vince and Phyllis Bacon to fund interns, booked as a credit against intern wage expense instead of as contribution income. The same donor's September gift went to 4029 Sponsorships correctly, so this is a misposting rather than a policy. It understates both contributions and wages by \$45,000 on the Form 990, and understates the fringe base by 2.5% — which is the whole of the difference between a 21.90% and a 22.45% reading of the fringe rate. |                                                    |                                                                      |          |       |                      |
| PAYROLL_REGISTER                                                                                                                                                                                                                                                                                                                                                                                                                                                              | 5129 Payroll Expenses:5139 Wages:5142 Intern Wages | register                                                             | (53)     | 0     | ROUNDING             |
| 53.23 on a 1,835,047.17 base — three thousandths of one per cent — with no transaction behind it. The controller's workbook distributes dollars across 43 people and sixteen objectives and rounds each cell; no single line accounts for it, and none can be named.                                                                                                                                                                                                          |                                                    |                                                                      |          |       |                      |

The same record, as the auditor meets it. Reading the cost record is one permission and they hold it by rank; they hold no portfolio and can change nothing. A nav stricter than the API is the same defect as one looser — both mean the screen and the server disagree about who you are.

---

**What is deliberately missing from these pictures.** No rate appears on any classification screen. No timesheet was adopted and no certification signed — those belong to the forty-three people whose effort it was, and this walk photographs the screens where they would act rather than acting for them. The sealing and the computing *were* performed, because they are controller steps being tested, and they ran against a throwaway database that was dropped afterwards.

Regenerate: `scripts/walk_runbook.py` then `scripts/runbook_guidebook.py`. The walk fails on a step that cannot be performed or a screen that comes up blank, so a picture of nothing cannot pass for a picture.
